

Top Hand Stockmanship & Stewardship Contest - Rules

Eligibility: This contest is open to 8th-12th grade students in Georgia. Each team will consist of three members. Teams must be entered on an official entry form and provide a completed permission form, which will include each team member's parent's signature indicating their permission for their child to participate.

All team members are required to be Beef Quality Assurance (BQA) Certified in order to compete. BQA certification must be completed/verified and submitted the day of the contest. BQA Certification can be completed online at the National BQA website. We recommend the cow-calf certification but encourage team members to take others. <https://bqa.beeflearningcenter.org/>

Parent permission forms must also be signed and sent to marrissa@uga.edu BEFORE the day of the contest. The forms can be found at [our website](#). These forms are a fillable PDF and can be electronically signed and submitted for your convenience.

Contest Protocol: Each team will be required to work three head of feeder cattle through a holding pen into a chute and properly catch each animal's neck in a head gate. Before the cattle processing begins, each team will be given the products to be used along with a cattle processing plan map and form. Team members will be required to complete the cattle processing plan form in 30 minutes. Information included on the processing plan includes products to be used, route of administration, location on animal for application, dosage, and pre-slaughter withdrawal time. The cattle processing plan will account for 20 out of 90 total points. All maps will be scored (and corrected if needed) and returned to each team as their turn arrives to compete at the chute.

Each team will be responsible for the preparation and administration of each animal health product which can include the following:

- Tissue Sampling
- Vaccines (Modified Live, Killed or Combo)
- Ear Tags (Visual & EID)
- Dewormer (Pour-On, Injectable, or Drench)
- *Other Products as Deemed Appropriate*

The correct procedure for administering each product will be explained to contestants prior to working the cattle (ie. weight for calculating dosages, placement of any ear tags). Failure to apply a product or improper administration will result in point deductions. Products should be applied in accordance with the team's approved cattle processing plan.

Teams will be evaluated on the way in which they handle the cattle and use the handling equipment. Unnecessary rough or harsh handling of the cattle will result in point deductions. Only equipment provided by the contest will be allowed. The use of any other driving sticks, canes, or other devices is prohibited. Handling will account for 10% of the possible score. The safety of the competitors will be emphasized. The cattle should be handled as safely as possible to minimize any potential for injury to team members. If the judges feel that a potentially dangerous situation exists, processing will be stopped. Safety will account for 10% of the possible score.

The actual cattle working will be timed. Timing will begin after the cattle processing plan is approved by the judges. Speed will account for 10% of the score. Any time over 15mins will not receive any points for time.

There is a total possible score of 90 points at the contest. Any ties will be broken with the score from cattle processing plan category. If a tie still exists, a tie-breaker will be decided by the contest judges and staff.

Guidelines for Scoring

Points are awarded in 3 separate categories within the Youth Cattle Handling Contest. One of these for the Cattle Processing Plan; the second area is for each product administered, as well as the safety and handling of cattle; and the third area is for time.

I. The Cattle Processing Plan provides information about the products that are used, how they are used, and where they are administered. This document becomes a permanent health record for this group of cattle. If the cattle are sold this document would accompany the cattle, so the new owner is aware of the details surrounding health products administered to the cattle. Every cell on the plan should have something written in it for each product used, do not leave information blank.

The Cattle Processing Plan is worth a total of 20 points. In the Cattle Processing Plan, the following information is requested, and guidelines for answering these items are provided:

1. **Product Name:** Complete name of product as it appears on the label. Subtract 1 point if incorrect.
2. **Route of Administration:** The footnote of the Processing Plan provides the following possible responses - *Subcutaneous (SQ)*, *Intramuscular (IM)*, *Topical (T)*, *Oral (O)*, *Intradermal (ID)*, *Intranasal (IN)* and *Ear Tag (ET)*. Proper administration is found on the label. Do not include where the product is administered here, that information is dealt

with separately. When the choice of SQ or IM is given, the proper response is always SQ. Subtract 1 point if incorrect.

3. **Location of Administration:** Location is to be noted on the animal illustrations which appear at the top of the Cattle Processing Plan by writing the number of the product on the designated space. Injectable products can be given only in the neck. Note that there is a right side and a left side depiction provided. Do not give 2 different injectable products in the same location. Subtract 1 point if incorrect.

For pour-on dewormers, draw a line with a beginning and ending point to indicate the entire region of the top line where the product is to be poured. Subtract 1/2 point if incompletely depicted.

4. **Dose:** Dosing information is found on the product label. Dose provided needs to be practical based upon the instrument used to measure the dose. In other words, if a dewormer is calculated to be given at the rate of 26.4 ml, and the dosing instrument is scaled in multiples of 5 ml, then the dose given should be listed as 30 ml. You can't accurately measure the 26.4 ml dose with the instrument used, and under dosing of dewormer is a bad technique, so you would round up. Subtract 1 point if the dosages incorrect.

The weights on the cattle will have to be estimated prior to calculating the proper dosage.

Likewise, insecticide impregnated ear tags are often stated to be put in each ear. Thus, the proper way to indicate this dose is "2-(1 in each ear)". Subtract 1/2 point if this information is not provided in the plan.

5. **Pre-Slaughter Withdrawal:** Should be recorded in days. This information is found on the product label. If there is no withdrawal required, then record a '0' in the space for that product. Subtract 1 point if the cell is left blank, or information provided is incorrect. Subtract 1/2 point if the statement about ear tag removal is not included.

II. The Judges Score Sheet provides specific information about each product. The judge's job is to evaluate the proper use of the instrument, proper handling of the product, safe and effective delivery of the product to the cattle, and to determine if the product is given in the way described on the Cattle Processing Plan. The judge is to closely observe these factors for each calf worked by the team. **Ten (10) points are available for each product, for a total of 60 possible points.**

NOTE: Point deductions are at the discretion of the judge. Additional points may be deducted if the judge deems necessary.

Specific guidelines for evaluation and scoring for each type of product are as follows:

1. **Dewormer** -In contrast to implants which are all administered in the same way, there are several different ways in which dewormers are designed to be administered, based upon the product. These include oral liquids administered with a drench gun, oral pastes

administered with a specific gun-type device, topical liquids designed to be poured on the back, and injectable forms. In the case of all but the injectables, the measurement of a specific dose is somewhat imprecise due to both the volume of product included in a single dose, and also to the accuracy of measurement with the application device. Consequently, the dose applied should be rounded up to the next higher amount that can be measured with the device, rather than some "in-between" quantity.

Orally administered products (liquid or paste) must be given in such a fashion that the calf does not spit it out. Proper technique involves getting the applicator over the top of the tongue before depressing the trigger. The best way to do this is by entering the side of the mouth with the instrument and gently forcing it between the molars and over the tongue. Putting your hands in the mouth is both awkward and dangerous. With boluses the hand is inserted in the side of the mouth opposite where the worker stands and pressure on the roof of the mouth results in the calf opening his mouth so that the balling gun can be inserted over the root of the tongue.

Proper use of the applicator involves setting it to the proper dose based on weight of the cattle and also on the dose described on the label. The applicator needs to be positioned in such a way that product flows into the gun when it is supposed to "reload". Failure to do this means an incomplete dose is brought into the applicator.

Topically applied products (also known as pour-on) are normally applied in a line down the back of the animal from withers to tailhead. Pouring these products in a pool in a single spot is bad technique, resulting in improper absorption of the product. These products often have a safe handling warning on the label, the result being that they should not be handled with bare hands. To avoid splashing product on a teammate, the injections should be completed before the topical dewormer is applied.

Applicators can be gun-type devices with adjustable dosing capability that pump product out of a large container or reservoir. There is also a direct applicator bottle whereby a single dose is squeezed from one location of the bottle into another region of the bottle, and this in turn is poured directly onto the calf. The cap of the bottle must be loosened to allow the product to flow from one portion of the bottle into the other.

The full 10 points would be awarded to a team that does all of these techniques correctly the first time. Subtract 2 points each time the following occurs-improperly measuring the dose on a squeeze-bottle applicator, calf spitting out a dose of orally-administered product, failure to re-administer product if the calf spits it back out, handling products labeled as hazardous without gloves. Subtract 1 point each time the following occurs-failure to apply the topical product from withers to tailhead, failure to insert the applicator of an orally-administered product sufficiently far into the mouth, failing to wait for teammates to complete injections before applying a topical product.

Judge should point out errors that pose a safety risk (not wearing gloves) or that result in improper dose being applied (gun not set properly). If team fails to adjust their technique

then deduct an additional point and do not allow them to proceed without fixing the error. Point deductions are at the discretion of the judge.

2. **Vaccination injections.** These should all be given in front of the shoulder and according to label directions and the processing map. Watch carefully to be sure that SQ shots are being administered under the skin. Deduct one point each time if SQ injects are given too deep so that an IM injection is erroneously given. Either the one-handed technique (needle goes in at a very steep angle) or two-handed tenting technique are acceptable. Deduct 2 points for each injection given behind the neck, too high, too low, or too far forward (outside of the “triangle”).

IM injections should be given in the triangle in front of the scapula, above the neck vertebrae (tendency is to give the injection too far down where neck bones are), and at least 2 inches down from the top of the neck to stay out of the ligamentum nuchae. All IM injections should be given deep enough to be sure they are in the muscle (depth of a 1” needle). Aspiration to be sure that the needle is not in a vessel is required. Subtract 2 points if the shot was given IM instead of SQ. Deduct 1 point for each wrong placement, not deep enough or failure to draw back.

Intranasal products require administration in both nostrils. The IN cannula must be used and replaced for each calf. Deduct 2 points for failure to change cannulas between calves. Deduct 2 points for improper administration (putting all of the product in one nostril, not properly administering product in nostril, etc.)

Vaccine hydration is often required. If vaccine is not properly hydrated or mixed deduct 2 points.

One needle should be put in the vaccine bottle and a separate needle used to give the vaccine so that a needle that has been used to give an injection is never put into the vaccine bottle. Deduct 2 points if this protocol is not used.

If a needle is dropped or bent it should be replaced. Deduct one point for use of dirty or bent needles

3. **Tags.** The type of tags – insecticide or identification – will be left up to the discretion of the site coordinator and the owner of the cattle. Tags should be placed according to label directions in terms of number: 1 or 2 per animal or location instructions per the producer. Deduct one point for each missed tag. All insecticide tag instructions call for handling with gloves. Deduct 2 points if gloves are not used.

Tag placement is in the center of the ear, between the two cartilage ribs in the ear. Putting them through the cartilage rib predisposes to infection. Placement too close to the end of the ear increases tear out. Deduct one point for each tag incorrectly placed.

4. **Cattle handling:** Scoring for this is somewhat subjective. Nice, smooth, quiet handling is being sought. Points may be deducted for noisy or rough handling and errors in catching

heads, moving cattle, etc.

Common Errors Include:

- Missed head
- Failure to use or release squeeze
- Failure to use or remove bar behind calves - Excessive roughness in moving cattle.
- Failure to use or latch crowd gate.

It may be necessary to reach into a chute to move cattle. If this is done correctly it should not result in deductions for safety. The reach must come from high enough in the chute to be above where calves would usually pass to cause arm injury. Cattle may be encouraged to move forward in the chute by walking past them from front to back, by gentle pokes with a working stick or by twisting a tail. Points should be deducted for excessive poking with a stick or outright hitting cattle.

Deductions should not be made for cattle turning around in the chute or alley if this is beyond the control of the handlers. How the handlers deal with such an event is a subjective way to assess the team's handling ability.

5. **Safety:** Any action that seems to put the handlers or cattle at risk may result in a deduction for safety. No deduction should be made for putting an arm through the chute if it is done appropriately and high enough in the chute so a calf cannot injure the arm.

Common Errors Include:

- Handler's head too close to the calf's head during tagging or implanting so the calf can swing their head up and strike the handler.
- Dropping the tail gate on the calf
- Attempting to inject in the neck in front of the head catch.

6. **Time:** Maximum points scored for time is 10. **Any time over 15 minutes will not receive points for this portion of the contest.** Scoring for time is as follows:

- | | |
|-------------------------------------|-----------------------------------|
| ○ Under 10 Mins. (10 points) | ○ 12:31-13:00 (4 points) |
| ○ 10:01-10:30 (9 points) | ○ 13:01-13:30 (3 points) |
| ○ 10:31-11:00 (8 points) | ○ 13:31-14:00 (2 points) |
| ○ 11:01-11:30 (7 points) | ○ 14:01-14:30 (1 points) |
| ○ 11:31-12:00 (6 points) | ○ 14:31-15:00 (.5 points) |
| ○ 12:01-12:30 (5 points) | ○ Over 15 Mins. (0 points) |

Additional Contest Rules

Sequestration of Teams: At the Contest teams will be sequestered in a holding location after completing their processing plan. Teams will remain in the designated area until it is their turn to work their cattle.

Rules adapted from the Virginia Youth Cattle Working Contest and Carroll County Cattlemen's Youth Handling Contest.
